Correlation Report

(salary and mba)

correlation the report relationship between **MBA Percentage (mba_p)** and **Salary**.

1. Correlation Analysis: salary vs mba_p

- **Correlation Coefficient (r): 0.141417**
- **Direction: Positive**
- **Strength: Weak**

2. Interpretation of the Results

The correlation coefficient of approximately **0.14** provides the following insights:

- **Direction of Relationship:** Since the value is positive, there is a **direct relationship**. This means that, generally, as a student's MBA percentage increases, their salary also tends to increase.
- **Strength of Relationship:** since a correlation value of **0.14** is considered **weak**. While there is a positive trend, the MBA percentage alone is not a strong predictor of the final salary. Other factors (like ssc_p or degree_p, which have higher correlations of 0.55 and 0.42 respectively) likely play a much more significant role in determining salary.

3. Comparison with Other Factors

To put this into perspective, let's look at how other academic scores correlate with Salary in your data:

Feature Pair	Correlation (r)	Strength
ssc_p & salary	0.558	Moderate
hsc_p & salary	0.459	Moderate
degree_p & salary	0.423	Moderate
mba_p & salary	**0.141**	**Weak**

Summary Conclusion

While performing well in an MBA program (mba_p) has a positive impact on salary, the dataset suggests that **earlier academic performance** (School and Degree percentages) has also have a much stronger influence on the salary package offered during placement than the MBA score itself. This could imply that recruiters also factor in academic track record over the final MBA specialization score.
