CoVariance Report

(Etest/MBA & Etest/Degree)

Based on the covariance matrix arrived, here is the relationship report :

1. Covariance Report: etest_p and mba_p

- **Covariance Value:** 16.886973
- **Direction: Positive**
- **Inferrence:** Since the value is positive, there is a **direct relationship** between the Entrance Test percentage (etest_p) and the MBA percentage (mba_p). This indicates that students who score higher on their entrance exams generally tend to achieve higher percentages in their MBA program.

2. Covariance Report: etest_p and degree_p

- **Covariance Value:** 22.078774
- **Direction: Positive**
- **Inferrence:** This value is also positive, indicating a **direct relationship** between the Entrance Test percentage (etest_p) and the Degree percentage (degree_p). As the entrance test scores increase, the degree scores also tend to increase.

Pair	Covariance Value	Relationship Type
etest_p vs mba_p	16.89	Positive / Direct
etest_p vs degree_p	22.08	Positive / Direct

Comparison and Key Takeaways:

1. **Directional Movement:** In both cases, the relationship is positive. This suggests that the "Entrance Test" is a consistent indicator of academic performance—if a student is a high achiever in the entrance test, he is more likely to be a high achiever in their degree and MBA as well.
2. **Magnitude (Size of the number):** we notice that **22.08** is larger than **16.89**. While covariance tells us the direction, it doesn't decipher the "strength" because it is affected by the scale of the numbers.

Summary: Both pairs show a **Positive Covariance**, meaning they move in the same direction. As the data suggests that entrance test performance reflects the general academic capability of the students across their degree and MBA studies.
